 Spin waves

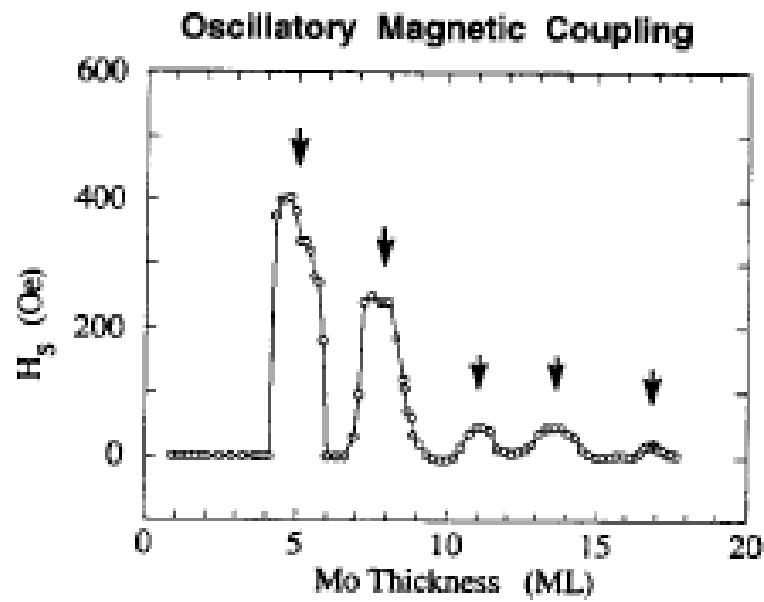

RKKY interaction

RKKY interaction

(a)

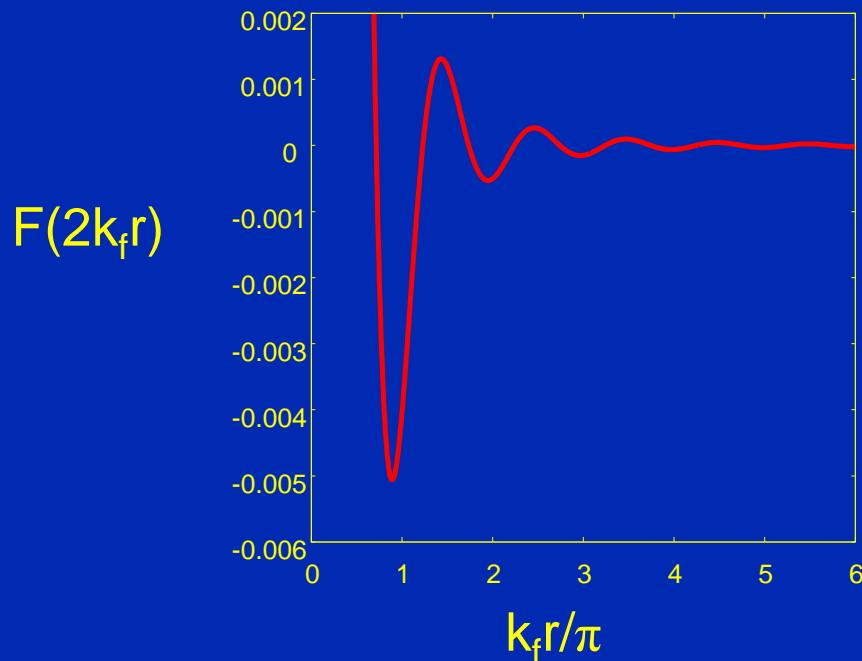

(b)

Figure 38. Magnetic oscillations at Fe/Mo/Fe(100) trilayers determined by the SMOKE (Qiu *et al.* 1992b). (a) Hysteresis loops characteristic of parallel and antiparallel coupling (top and bottom). H_s is the magnetic field required to force antiparallel layers parallel. Adding just slightly more than a monolayer to the Mo spacer reverses the magnetic orientation. (b) Alternating antiparallel and parallel coupling (arrows and baseline respectively).

Spatially varying fields

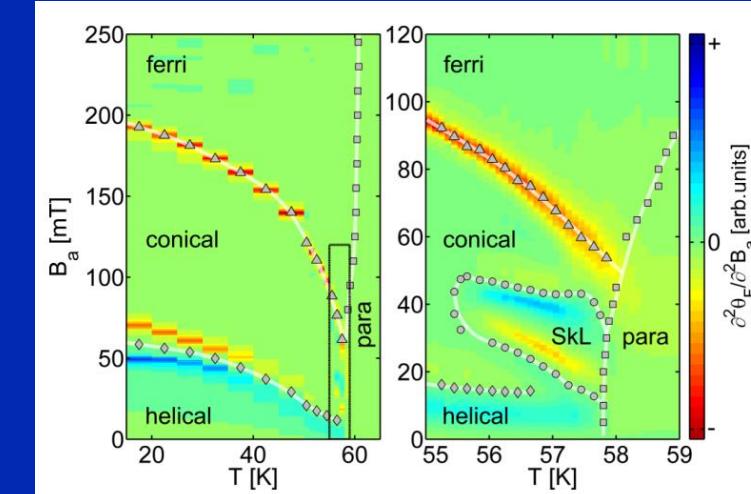

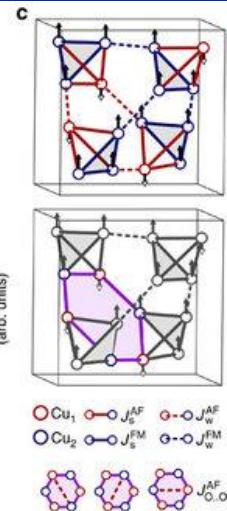

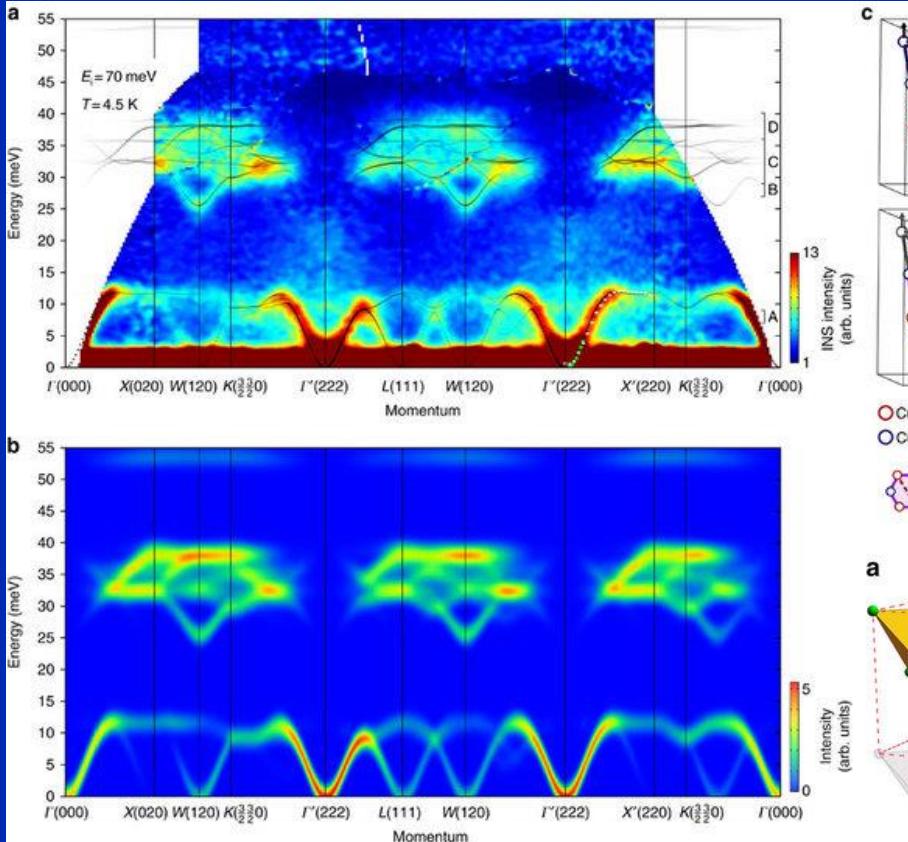

- RKKY interaction (*Ruderman-Kittel-Kasuya-Yosida*)

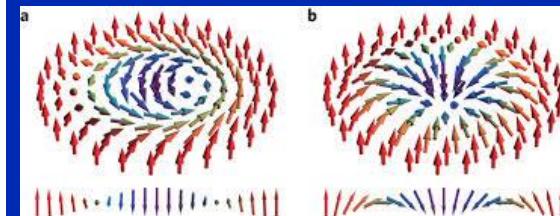

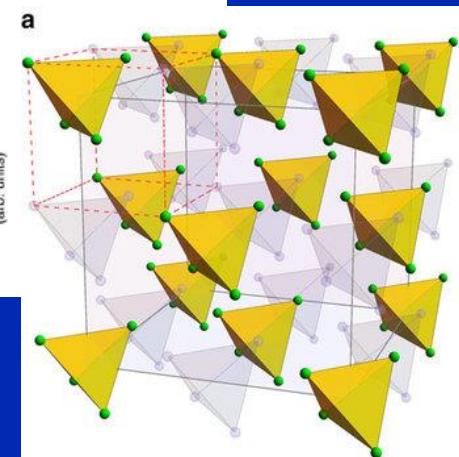

$$H(r) = H_0 \delta(r)$$

$$\chi(r) = \frac{2}{\pi} k_f^3 \chi_{pauli} F(2k_f r) \xrightarrow{x \gg 1} -\frac{2}{\pi} k_f^3 \chi_{pauli} \frac{\cos(2k_f r)}{(2k_f r)^3}$$

Spin wave excitations in Cu_2OSeO_3

R. Versteeg et al., PRB 2016
