

Condensed Matter Physics I

Prof. Dr. Ir. Paul H.M. van Loosdrecht

II Physikalisches Institut, Room 312

E-mail: pvl@ph2.uni-koeln.de

Website: <http://www.loosdrecht.net/>

Previously

- Free electron model
- Density of states, Fermi-Dirac distribution
- Pressure, Bulk modulus, Heat capacity, Thermal mass
- Charge conductivity
- Classical Hall effect
- Electronic thermal transport, Wiedemann-Franz
- Failures of free e- model
- Incorporation periodic potential, Bloch states, gaps

Today

Band structure: Approaches

- Empty lattice (only periodicity)
- Perturbation theory (nearly free electrons, weak potential)
- Tight binding method (LCAO)
- Exact models (Kronig-Penney model, see for instance Kittel)
- ‘advanced’ methods: see for instance
ashcroft and mermin, chapter 11

Electronic band structure of the superconductor Sr_2RuO_4

Tamio Oguchi

Department of Materials Science, Hiroshima University, 1-3-1 Kagamiyama, Higashi-Hiroshima 724, Japan

(Received 28 September 1994; revised manuscript received 8 November 1994)

FIG. 1. Calculated energy band structure of Sr_2RuO_4 along high-symmetry lines. A horizontal broken line denotes the Fermi energy.

FIG. 3. Calculated density of states (DOS) of Sr_2RuO_4 : (a) total DOS, (b) partial Ru d DOS, and (c) partial O p DOS. In panel (c), solid and dotted curves represent the partial p DOS of the O(I) and O(II) atoms, respectively. A vertical line denotes the Fermi energy.

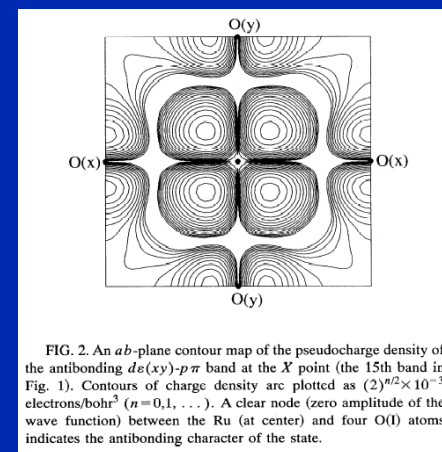

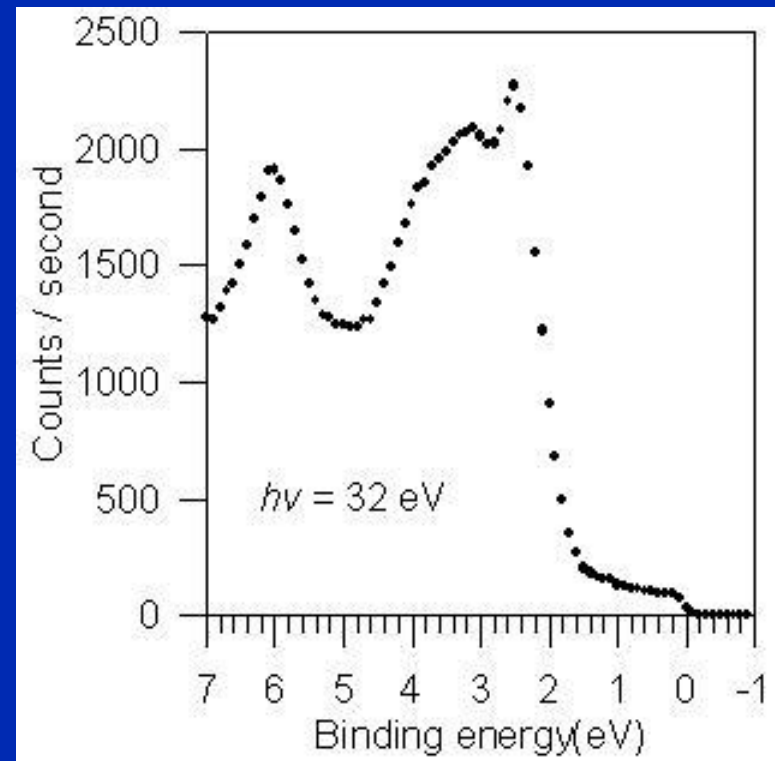

FIG. 2. An ab -plane contour map of the pseudocharge density of the antibonding d_{xy} - $p\pi$ band at the X point (the 15th band in Fig. 1). Contours of charge density are plotted as $(2)^{n/2} \times 10^{-3}$ electrons/bohr 3 ($n=0,1,\dots$). A clear node (zero amplitude of the wave function) between the Ru (at center) and four O(I) atoms indicates the antibonding character of the state.

Photoemission

$$E_{bind} = \hbar\omega - E_{kin} - \phi$$

$$\hbar k_{||}^i = \hbar k_{||}^f = \sqrt{2mE_{kin}} \sin \theta$$

FIG. 1. Comparison of the experimental and theoretical band structures of CaB_6 along Γ -X. The reverse gray scale image of ARPES intensities is the sum of two data sets with 30 eV s - and p -polarized excitation. Dashed lines are from the quasiparticle GW calculation [18] giving X-point gap between bands 0 and 1.

Bloch theorem

Bloch Theorem

$$\Psi_{\vec{k}}(\vec{r}) = e^{i\vec{k}\cdot\vec{r}} u_{\vec{k}}(\vec{r})$$

$$u_{\vec{k}}(\vec{r}) = u_{\vec{k}}(\vec{r} + \vec{R})$$

$$T_{\vec{n}} \Psi_{\vec{k}}(\vec{r}) = \Psi_{\vec{k}}(\vec{r} + \vec{R}_{\vec{n}}) = e^{i\vec{k}\cdot\vec{R}_{\vec{n}}} \Psi_{\vec{k}}$$

The eigenstates of a periodic one-electron Hamiltonian can be chosen to have the form of a plane wave times a function with the periodicity of the Hamiltonian

Remarks on Blochfunctions

1. Quantum number k : Crystal momentum

$$\frac{\hbar}{i} \nabla \Psi_{\mathbf{k}} = \frac{\hbar}{i} \nabla e^{i \mathbf{k} \cdot \mathbf{r}} u_{\mathbf{k}}(\vec{\mathbf{r}}) = \hbar \mathbf{k} \cdot \Psi_{\mathbf{k}} + \frac{\hbar}{i} e^{i \mathbf{k} \cdot \mathbf{r}} \nabla u_{\mathbf{k}}(\vec{\mathbf{r}})$$

2. k may be confined to the 1st BZ (Reduced BZ)

$$\Psi_{\vec{\mathbf{k}}+\vec{\mathbf{G}}} = e^{i \vec{\mathbf{k}} \cdot \vec{\mathbf{r}}} u_{\vec{\mathbf{k}}+\vec{\mathbf{G}}}(\vec{\mathbf{r}})$$

3. Band index n

Born-von Karman $\Psi(\vec{\mathbf{r}} + p_i \cdot \vec{\mathbf{a}}_i) = \Psi(\vec{\mathbf{r}})$

$$u_{\mathbf{k}}(\vec{\mathbf{r}}) = \sum_{\vec{\mathbf{G}}} C_{\vec{\mathbf{k}}+\vec{\mathbf{G}}} \cdot e^{i \vec{\mathbf{G}} \cdot \vec{\mathbf{r}}}$$

4. Band structure $\varepsilon_n(\vec{\mathbf{k}})$

Band structure: Approaches

Last time

- Empty lattice (only periodicity)
- Perturbation theory (nearly free electrons, weak potential)

Today

- Tight binding method (LCAO)

Other methods

- Exact models (Kronig-Penney model, see book)
- ‘advanced’ methods: Ashcroft & Mermin chapter 11

Tight binding approach

Tight binding

Atomic orbitals $\varphi(\mathbf{r})$: $H_{\text{at}} \varphi(\mathbf{r}) = E_{\text{at}} \varphi(\mathbf{r})$

Solid state: $H = H_{\text{at}} + V(\mathbf{r})$

$$\Rightarrow \Psi_{\vec{k}}(\vec{r}) = \frac{1}{\sqrt{N}} \sum_j e^{i\vec{k} \cdot \vec{r}_j} \cdot \varphi(\vec{r} - \vec{r}_j)$$

1st order correction to energy: diagonal elements

$$\begin{aligned} \langle \mathbf{k} | H | \mathbf{k} \rangle &= \frac{1}{N} \sum_j \sum_m e^{i\vec{k} \cdot (\vec{r}_j - \vec{r}_m)} \cdot \langle \varphi_m | H | \varphi_j \rangle \\ &= \sum_m e^{i\vec{k} \cdot \vec{\rho}_m} \cdot \int dV \varphi^*(\vec{r} - \vec{\rho}_m) H \varphi(\vec{r}) \end{aligned}$$

Tight binding

$$\langle \mathbf{k} | \mathbf{H} | \mathbf{k} \rangle = \sum_{\mathbf{m}} e^{i \vec{k} \cdot \vec{\rho}_{\mathbf{m}}} \cdot \int dV \varphi^*(\vec{r} - \vec{\rho}_{\mathbf{m}}) \mathbf{H} \varphi(\vec{r})$$

Only nearest neighbours:

Self $\rho = 0 \Rightarrow \int dV \varphi^*(\vec{r}) \mathbf{H} \varphi(\vec{r}) \equiv -\alpha$

N.N. $\rho_{\mathbf{m}} = \rho \Rightarrow \int dV \varphi^*(\vec{r} - \vec{\rho}) \mathbf{H} \varphi(\vec{r}) \equiv -\gamma$

$$\varepsilon(\mathbf{k}) = \langle \mathbf{k} | \mathbf{H} | \mathbf{k} \rangle = -\alpha - \gamma \cdot \sum_{\mathbf{nn}} e^{-i \vec{k} \cdot \vec{\rho}_{\mathbf{nn}}}$$

Tight binding

$$\varepsilon(\mathbf{k}) = \langle \mathbf{k} | \mathbf{H} | \mathbf{k} \rangle = -\alpha - \gamma \cdot \sum_{nn} e^{-i \vec{k} \cdot \vec{\rho}_{nn}}$$

S.C.: n.n. at $(\pm a, 0, 0)$; $(0, \pm a, 0)$; $(0, 0, \pm a)$

$$\varepsilon(\mathbf{k}) = -\alpha - 2\gamma [\cos(k_x a) + \cos(k_y a) + \cos(k_z a)]$$

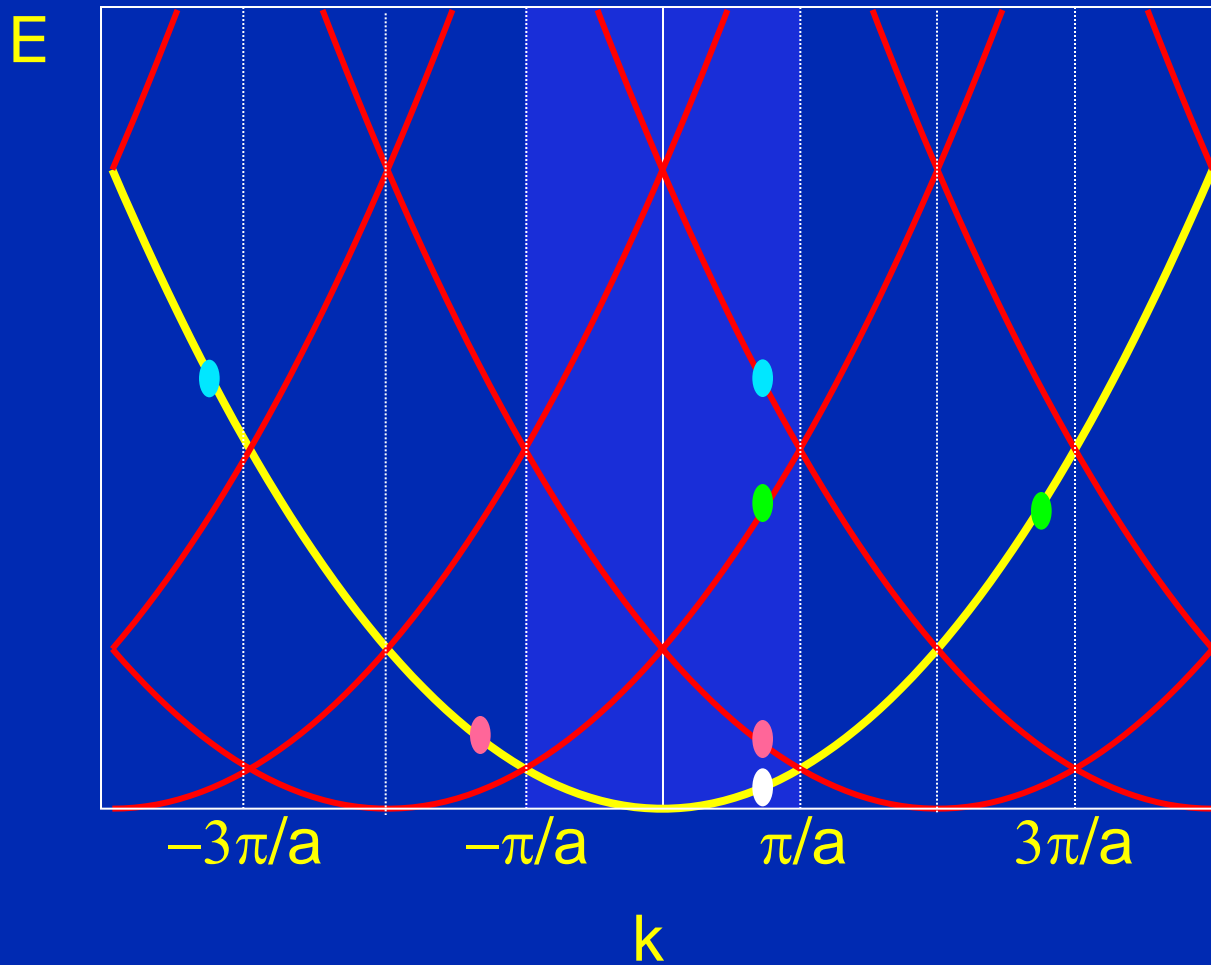

Tight binding

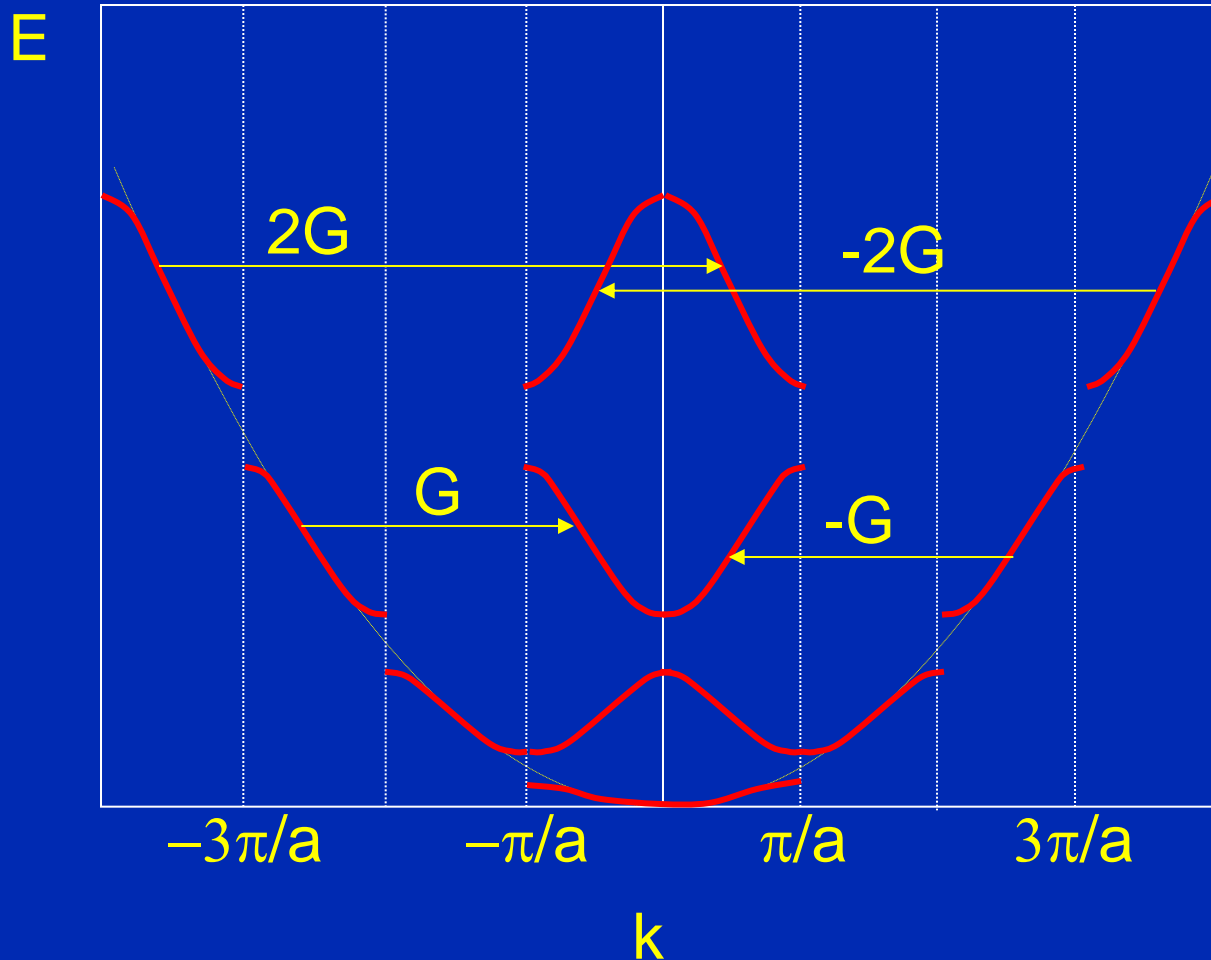

- TB method: Insulators and core electrons and d-electrons in transition metals (e.g. Cu, V, Ti etc.).
- Nearly free electron model: conduction electrons, s or p, alkali (e.g. Na, K, etc.)
